The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method has been developed for screening for substances which inhibit CC the binding of TAKI polypeptide to TABI polypeptide. The method CC comprises: (a) contacting the polypeptide in the presence of a sample; CC and (b) detecting the amount of bound polypeptide, in which the sample (CC and be pre-mixed with TAKI or TABI polypeptide first. The transforming CC growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement CC inhibitors or activators, or cell proliferation prevention inhibitors or activators, or immunosuppression inhibitors or activators, or amploid beta protein precipitation inhibitors or activators, or amploid beta protein precipitation inhibitors or activators, and such substances can also be CC inhibitors of the TAKI polypeptide function, particularly Kinase CC activity. The present sequence represents human TAKI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAKI and its receptor TABI and selecting for inhibition of TAKI/TABI binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the compositions for the treatment of inflammatory disorders containing as active compositions for the inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-I (IL-I), IL-10, tumour necrosis factor (TNF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present sequence represents human TAK-I, which is used in the exemplification of

The method CC comprises: (a) contacting the polypeptide in the presence of a sample; CC and (b) detecting the amount of bound polypeptide, in which the sample; CC and be pre-mixed with TAKI or TABI polypeptide, in which the sample; CC growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or citivators, or extracellular matrix protein production enhancement CC inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or inmunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAKI polypeptide function, particularly kinase activator. The present sequence represents TAKI-6XHis from an example of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The process of the service of the service represents the amino acid sequence of human TAK1a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL8841) that encode proteins (B).

ABB8506-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·.

The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

The NFkB activated inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the amino acid sequence of human TAK1b

The NFKB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the amino acid sequence of human TAKIC

The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a the proteins are useful for identifying at the themself or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proceins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher sukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cel

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    185 KSNRIIINQPTGFQKVLQGNKPDEKCDVYSWAITFWEILSRKEPFEQY-NTLFELYMAIN 243

The present sequence represents a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and antagonists of HRIP polypeptide. HRIP and its agonist or antagonist are useful for treating a disease or condition associated with decreased or increased expression of functional HRIP. Diseases treated or diagnosed include neurological disorders such as stroke, Parkinson's

or diagnosed include ne disease, demyelinating

diseases,

bacterial

and viral

meningitis and

Parkinson's

cell signal transduction pathways are a misso the protein incompanies of cally see pathways. A protein kinase activity means that the SRK can catalyse a reaction in which a phosphate group is transferred from a phosphate acceptor amino acid residue, preferably the hydroxyl side chain of a serine or threonine. Substrates for SRK include SRK, MBP and BAD and SRK s protein kinase activity is similar to that of a MarkKK such as Raf. has a range of other activities including a cell growth-regulatory activity, a cell survival promoting activity, a HAX-1 binding activity, an apoptosis suppressing activity a MAPKK and a SRK-specific immunogenic activity. SRK is useful for identifying agents which modulate cellular transformations mediated by Ras and SRK-missing in the transformation activity of SRK. This information may be useful in the treatment of autoimmune diseases, tumours and apoptosis

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

mixed-lineage protein kinase (BC 2.7.1.-) 3 - human
N.Alternate names: protein kinase PTK1; protein kinase SPRK
C;Species: Homo sapiens (man)
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C;Accession: A53800; 158395
R;Gallo, K.A.; Mark, M.R.; Scadden, D.T.; Wang, Z.; Gu, Q.; Godowski, P.J.
Biol. (Chem. 269, 15092-15100, 1994
A;Title: Identification and characterization of SPRK, a novel src-homology 3 domain-conte
A;Reference number: A53800
A;Accession: A53800
A;Accession: A53800
A;Residues: preliminary
A;Molecule type: mRNA
A;Residues: 1-847 cGAL)
A;Residues: 1-847 cGAL)
